OBJECTIVE

The objective of this lab is to develop a responsive web application that provides information and support resources related to Domestic Violence and Gender-Based Violence (GBV) in Malaysia.

- Develop a responsive website.
- Apply modern front-end technologies.
- Provide important information, support agencies, laws and emergency contacts.

CREATING THE PROJECT

```
C:\Users\zaqwa>rails new gbv_support
      create
      create  README.md
      create  Rakefile
      create  .ruby-version
      create  config.ru
      create  .gitignore
      create  .gitattributes
      create  Gemfile
         run  git init from "."
Initialized empty Git repository in C:/Users/zaqwa/gbv_support/.git/
```

I created a new web application using Ruby on Rails. The framework automatically generated the basic project structure required for the website. I used custom CSS and media queries to provide responsive styling.

WEBSITE STRUCTURE

```
C:\Users\zaqwa\gbv_support>rails generate controller Pages home what_is contact law_enforcement enforcer hotline
      create  app/controllers/pages_controller.rb
       route  get "pages/home"
              get "pages/what_is"
              get "pages/contact"
              get "pages/law_enforcement"
              get "pages/enforcer"
              get "pages/hotline"
      invoke  erb
      create    app/views/pages
      create    app/views/pages/home.html.erb
      create    app/views/pages/what_is.html.erb
      create    app/views/pages/contact.html.erb
      create    app/views/pages/law_enforcement.html.erb
      create    app/views/pages/enforcer.html.erb
      create    app/views/pages/hotline.html.erb
      invoke  test_unit
      create    test/controllers/pages_controller_test.rb
      invoke  helper
      create    app/helpers/pages_helper.rb
      invoke    test_unit
```

The website is divided into several sections so users can easily access educational information, legal information, support agencies, emergency hotlines and contact information.

ROUTES (ROUTES.RB)

SafeSpace Malaysia / config/routes.rb

```ruby
Rails.application.routes.draw do
  root "pages#home"
  get "/what-is", to: "pages#what_is", as: :what_is
  get "/contact", to: "pages#contact", as: :contact
  post "/contact", to: "pages#preview_feedback", as: :preview_feedback
  get "/law-enforcement", to: "pages#law_enforcement", as: :law_enforcement
  get "/enforcer", to: "pages#enforcer", as: :enforcer
  get "/hotline", to: "pages#hotline", as: :hotline
  get "up" => "rails/health#show", as: :rails_health_check
  get "service-worker" => "rails/pwa#service_worker", as: :pwa_service_worker
  get "manifest" => "rails/pwa#manifest", as: :pwa_manifest
end
```

I linked each page URL to its action in the Pages controller. The root route opens Home, while POST /contact sends the feedback fields to the validation action.

PAGES CONTROLLER

SafeSpace Malaysia / app/controllers/pages_controller.rb

```ruby
class PagesController < ApplicationController
  def home
  end
  def what_is
  end
  def contact
    @feedback = {}
  end
  # A lab demonstration only. Feedback is never saved or delivered.
  def preview_feedback
    @feedback = params.permit(:name, :email, :message).to_h.transform_values(&:strip)
    @errors = []
    @errors << "Enter your name." if @feedback["name"].blank?
    @errors << "Enter a valid email address." unless @feedback["email"].to_s.match?(URI::MailTo::EMAIL_REGEXP)
    @errors << "Enter a message." if @feedback["message"].blank?
    @errors << "Keep the message within 1,000 characters." if @feedback["message"].to_s.length > 1000
    if @errors.any?
      render :contact, status: :unprocessable_entity
    else
      redirect_to contact_path(anchor: "feedback"), status: :see_other,
        notice: "Validation successful. This demonstration does not save or send your message."
    end
  end
```

The controller has an action for each page. The preview_feedback action checks the name, email and message, then returns errors or redirects with a confirmation. It does not save or send messages.

SHARED LAYOUT

SafeSpace Malaysia / app/views/layouts/application.html.erb

```
        <%= link_to root_path, class: "brand", aria: { label: "SafeSpace Malaysia home" } do %>
          <span class="brand__mark" aria-hidden="true">S</span>
          <span>SafeSpace <small>Malaysia</small></span>
        <% end %>
        <button class="nav-toggle" type="button" aria-expanded="false" aria-controls="main-navigation">Menu <span aria-hidden="true">☰</span></button>
        <nav id="main-navigation" class="site-nav" aria-label="Main navigation">
          <%= link_to "Home", root_path, class: current_page?(root_path) ? "is-active" : nil %>
          <%= link_to "What Is GBV", what_is_path, class: current_page?(what_is_path) ? "is-active" : nil %>
          <%= link_to "Hotline", hotline_path, class: current_page?(hotline_path) ? "is-active" : nil %>
          <%= link_to "Law Enforcement", law_enforcement_path, class: current_page?(law_enforcement_path) ? "is-active" : nil %>
          <%= link_to "Enforcer", enforcer_path, class: current_page?(enforcer_path) ? "is-active" : nil %>
          <%= link_to "Contact", contact_path, class: current_page?(contact_path) ? "is-active" : nil %>
        </nav>
      </div>
    </header>
    <main id="main-content">
      <%= yield %>
    </main>
    <footer class="site-footer">
      <div class="container footer-grid">
        <div>
```

I placed the emergency banner, navigation and footer in application.html.erb so every page shares the same structure. Rails displays each page’s content where yield appears.

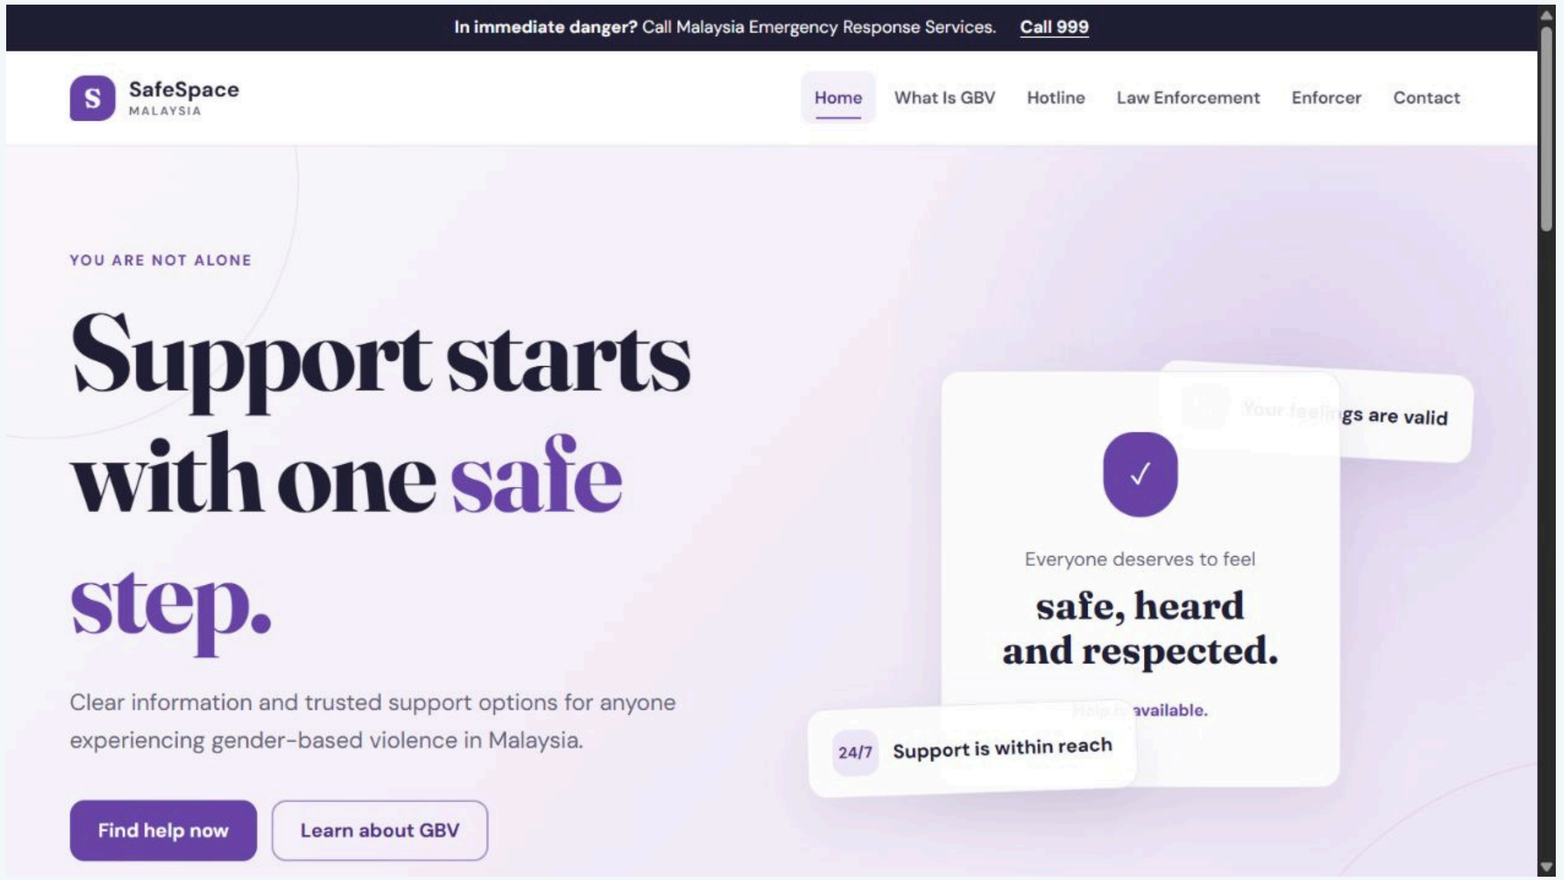

RESPONSIVE STYLING

SafeSpace Malaysia / app/javascript/application.js

```
01 // Configure your import map in config/importmap.rb. Read more: https://github.com/rails/importmap-rails
02 import "@hotwired/turbo-rails"
03 import "controllers"
04 // Rebind after Turbo visits because the shared layout replaces the navigation.
05 document.addEventListener("turbo:load", () => {
06   const toggle = document.querySelector(".nav-toggle");
07   const navigation = document.getElementById("main-navigation");
08   if (!toggle || !navigation) return;
09   toggle.addEventListener("click", () => {
10     const expanded = toggle.getAttribute("aria-expanded") === "true";
11     toggle.setAttribute("aria-expanded", String(!expanded));
12     navigation.classList.toggle("is-open", !expanded);
13   });
14 });
15
```

The website uses custom CSS media queries and CSS Grid. Below 980 pixels, a Menu button shows or hides the navigation. JavaScript updates aria-expanded so assistive technology can read its state.

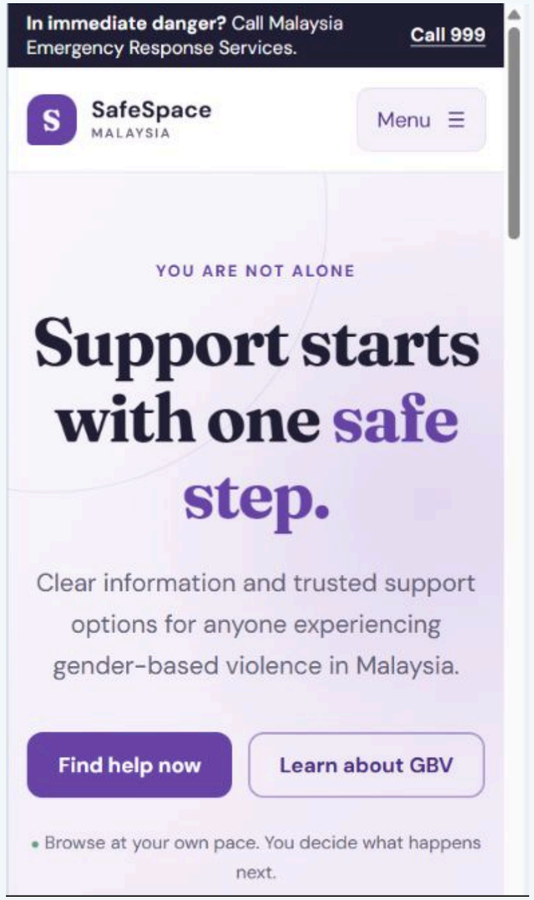

HOME PAGE

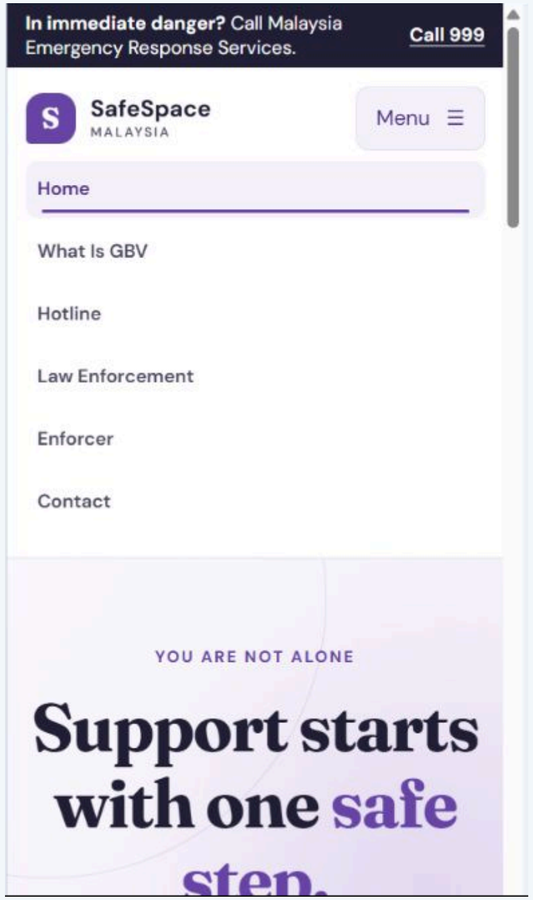

The Home page introduces SafeSpace Malaysia and provides clear links to information and support. “Find help now” opens the Hotline page, while the navigation connects all required sections.

MOBILE LAYOUT

MENU CLOSED

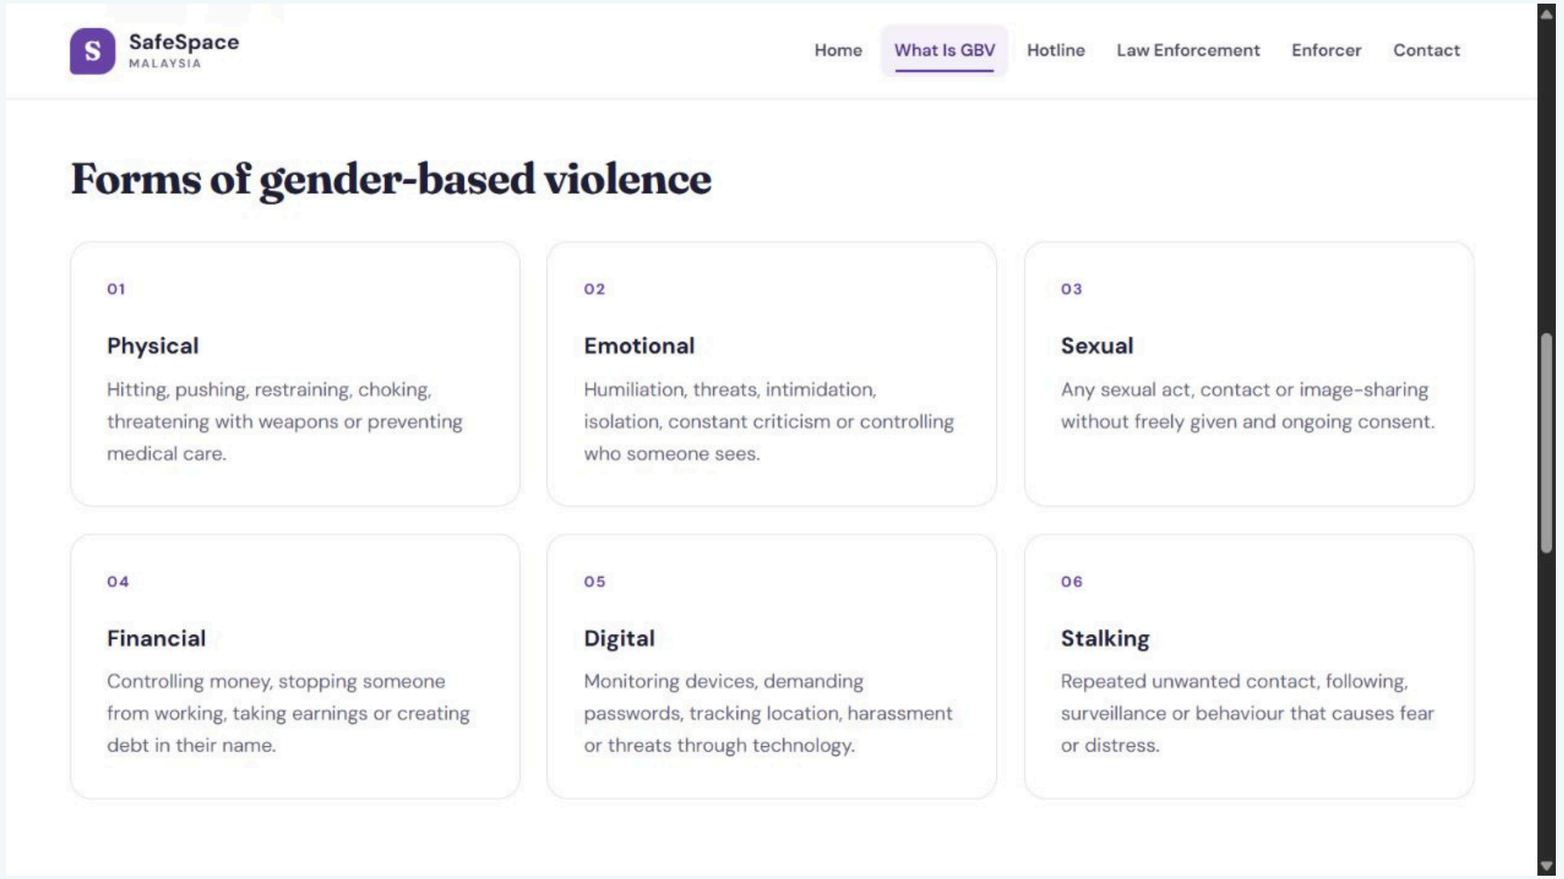

MENU OPEN

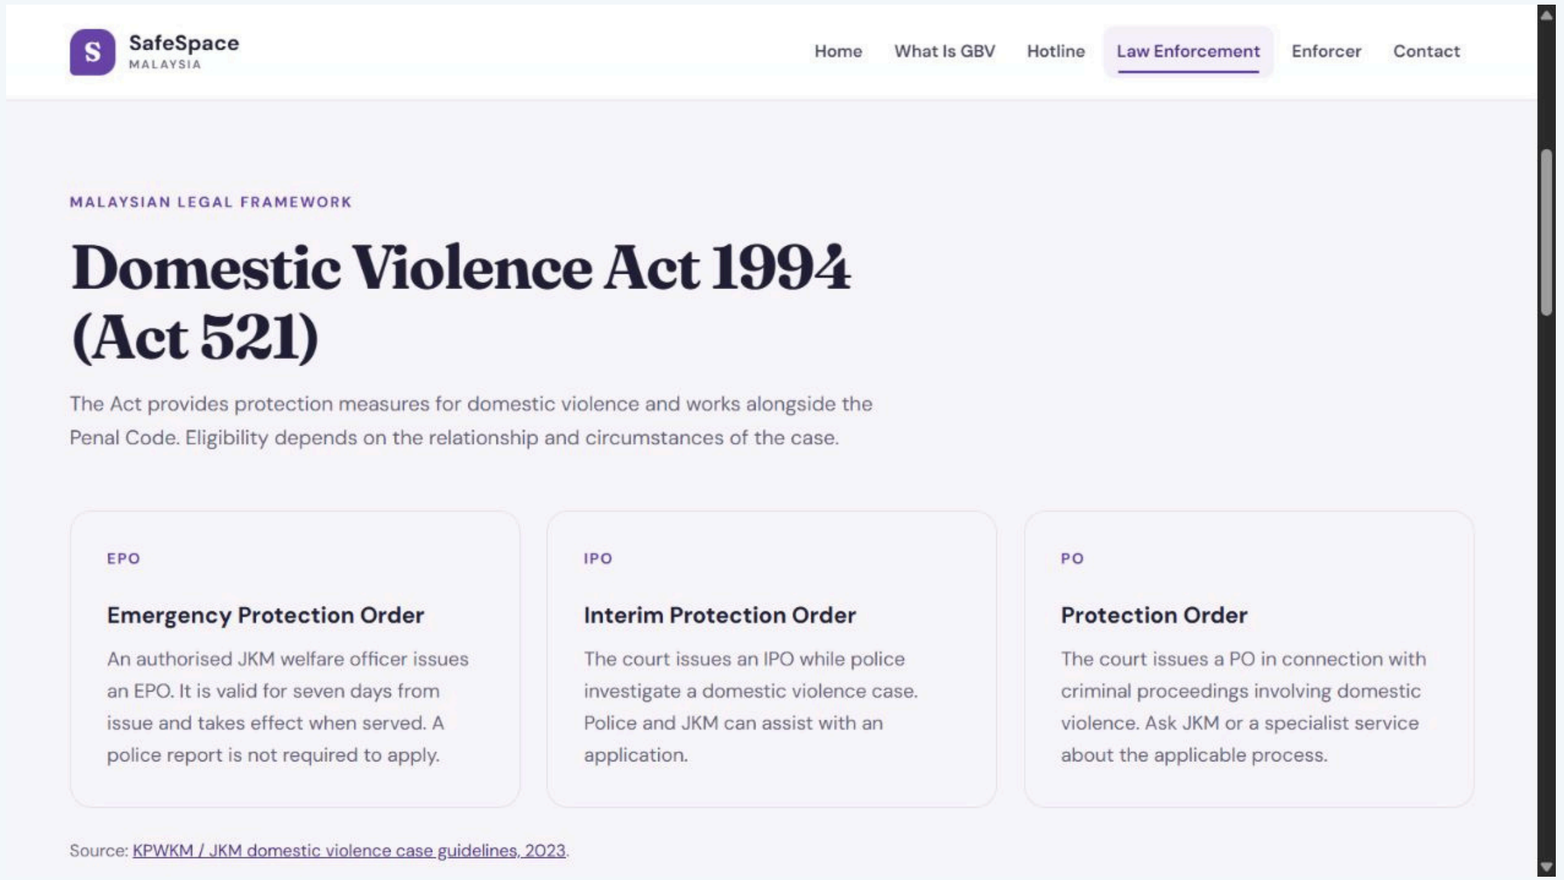

I tested the website inside a 390-pixel viewport. The navigation changes into a menu, and the page content stacks vertically. These screenshots show the menu closed and open.

WHAT IS PAGE

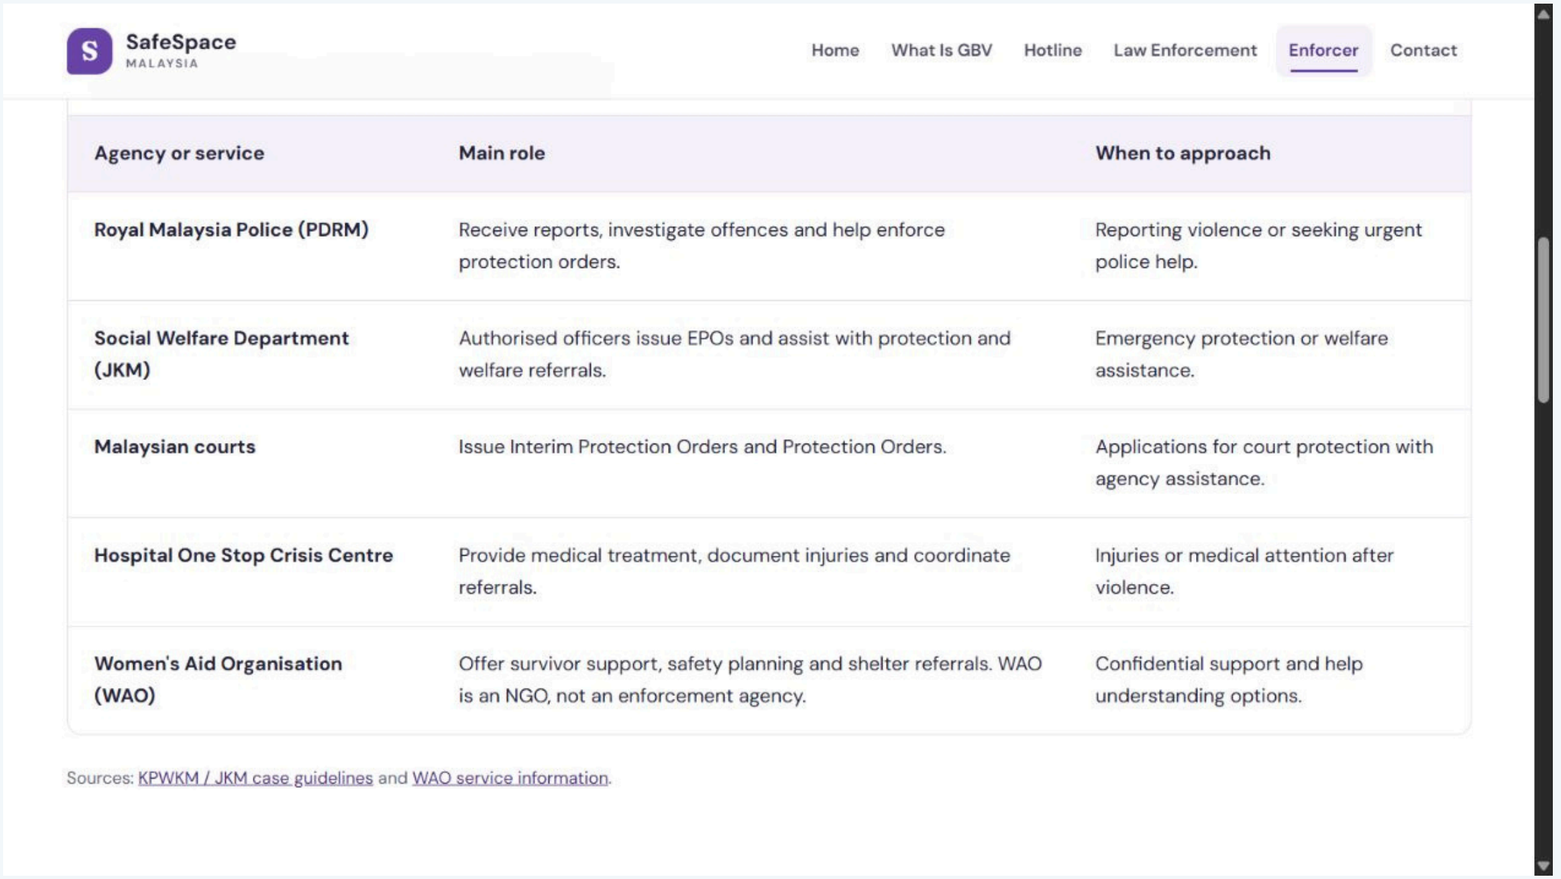

This page explains domestic violence and GBV, then presents six forms of abuse in a responsive grid. Warning signs and a support link help users decide where to find more information.

LAW ENFORCEMENT PAGE

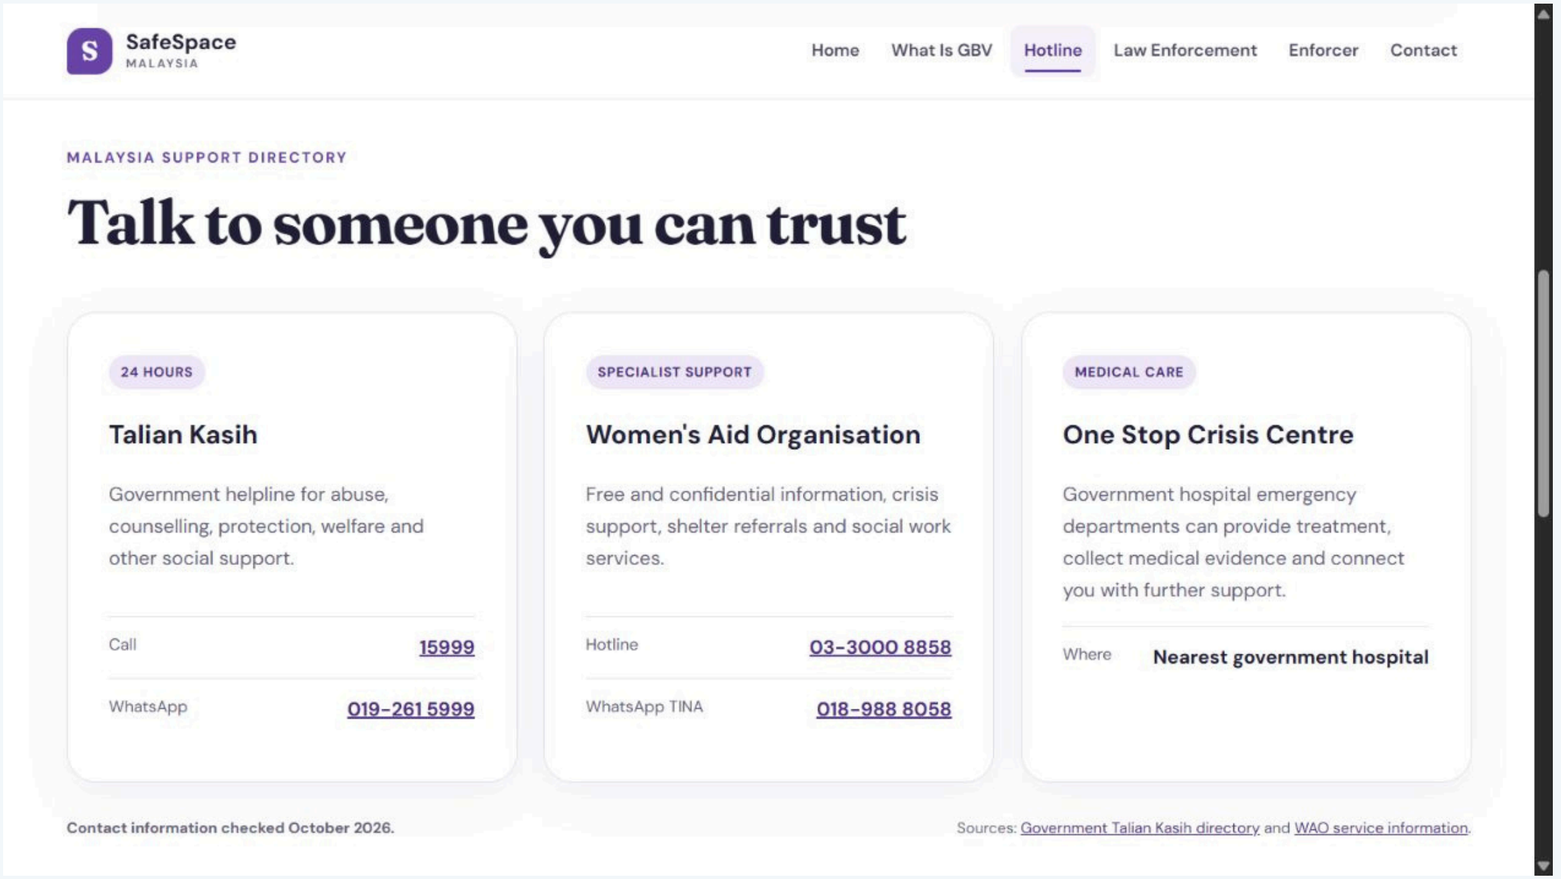

I added the Domestic Violence Act 1994 and three protection measures: EPO, IPO and PO. The page explains who issues each order and links to the government case-handling guidelines.

ENFORCER PAGE

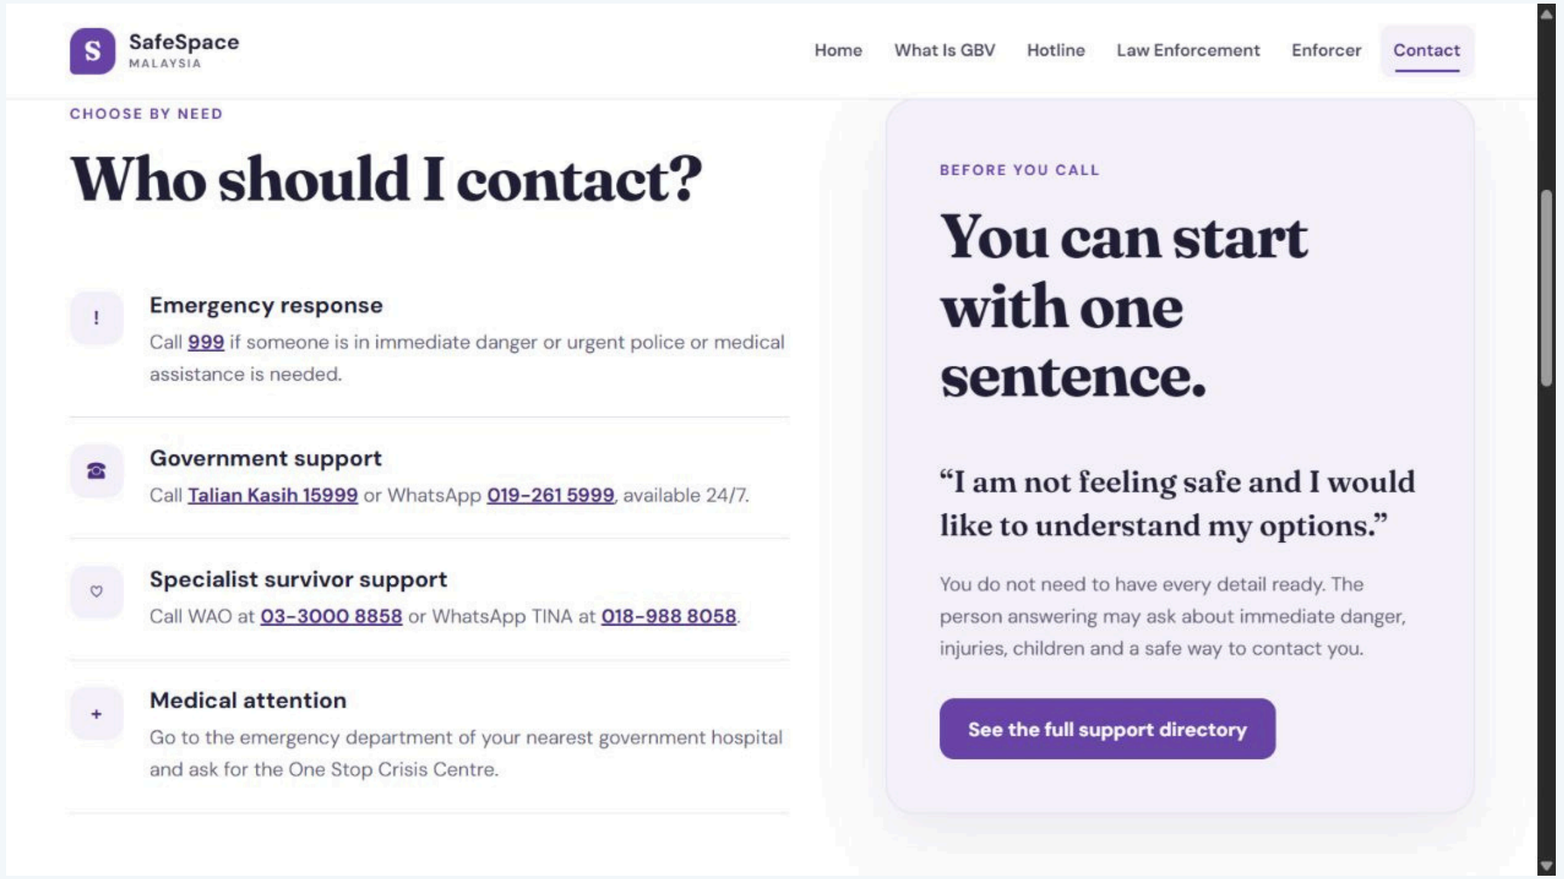

The agency table explains the roles of PDRM, JKM, the courts and hospital crisis centres. It also identifies WAO as a support NGO. On small screens, users can scroll the table horizontally.

HOTLINE PAGE

I displayed emergency and support services with clear call and WhatsApp links. Each service has a short description, and source links show where the contact details can be checked.

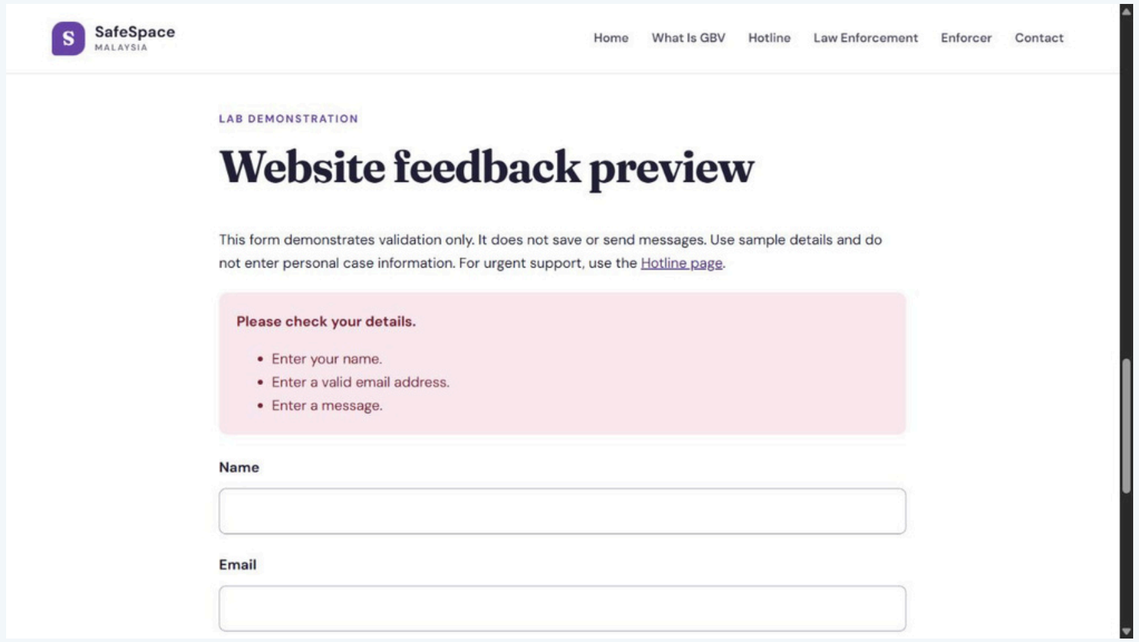

CONTACT PAGE

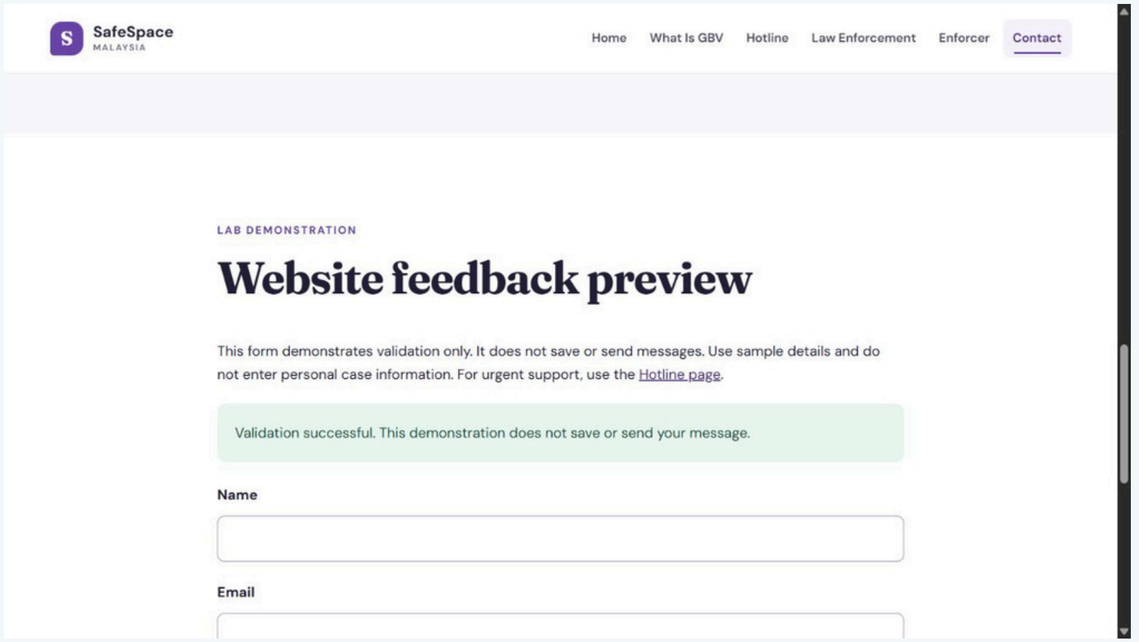

The Contact page directs users to the right service for emergency response, government support, specialist help or medical attention. A separate feedback preview demonstrates form validation using sample details.

FEEDBACK VALIDATION

EMPTY FIELDS

VALID SAMPLE DETAILS

An empty submission shows clear error messages. Valid sample details show a confirmation. Validation runs in the Rails controller, and the form clearly states that messages are not saved or sent.

TESTING THE WEBSITE

I checked all six page routes and tested empty fields, an invalid email, a long message and a valid submission. All 11 integration tests passed with 18 assertions and no failures or errors.
